

CLOUD SECURITY ASSESSMENT

We work with your IT and security groups to bring your cloud security posture into focus, with detailed analysis, experience and insight.

All organizations require an understanding of their security posture, including the infrastructure components and services and their interactions within the organization. As data and services move to the cloud, organizations must continually adjust to the increasingly complex and challenging cloud security landscape. Many must also comply with regulatory, industry and standards body requirements for cloud security controls and operations.

Our **Cloud Security Assessment** will provide you with a clear picture of the security posture of your cloud services.

Using Check Point Dome9, organizations can visualize and assess their security posture, detect misconfigurations, model and actively enforce security best practices, and protect against identity theft and data loss in the cloud.

Using Dome9, we ensure that your security posture is appropriate for each component. Detailed reports are created to ensure compliance with audit processes and procedures.

We will work with your IT and security teams to scope and perform a **Cloud Security Assessment**, focused on the following:

- Primary objectives of the assessment.
- Requirements gathering, scoping and inventory.
- Onboarding cloud services into the Dome9 platform.
- Cloud services processing and analysis.
- Findings reporting, validation and recommendations.
- Required reports and presentations.

For over 20 years, some of the world's largest corporations have entrusted us with the design, implementation, and support of their cybersecurity solutions.

Contact your Gotham Account Manager for more information on how we can help ensure your cloud security.
