

# GRC Health Check

It's the "not knowing what you don't know" in your GRC program that creates the most risk.

Most organizations are doing a lot of the right things, but they're not always sure if those efforts are aligned, complete, or focused on what matters most. GRC work piles up, teams are stretched thin, and it becomes hard to tell where real gaps exist versus where effort is being wasted.

*This is where a GRC Health Check helps.*

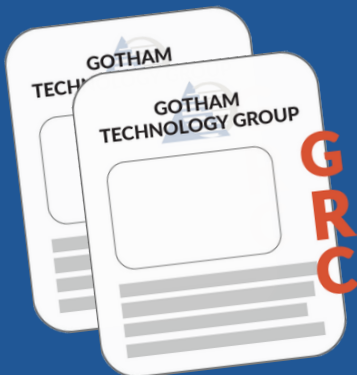

The goal is to understand your GRC program in the context of what your organization values most. We align first on your objectives, then review what's in place, so findings and next steps are practical, and relevant to your cybersecurity and business goals, not just checking boxes.

**Whether you're adopting a new framework, leveraging GRC tooling, or just want a better security posture overall, the Health Check is your next step.**

- 1** Align on outcomes
- 2** Review documentation and/or GRC tool
- 3** Readout and next steps

approx. 3-4 weeks

**Stop guessing. Get grounded.  
Move forward with confidence.**

Most teams don't need more tools or more work. They need a trusted partner to help them sort through what they have, understand what actually matters, and chart a clear path forward.

A GRC Health Check gives you that foundation.
